

## Quotation and Reference Information

In the area of information services, Moscow Exchange is mainly focused on publication of market data for its public circulation, which can be further used in risk management and automated trading systems, and in the development of new derivative indices.

Stakeholders can also receive access to the Exchange's archived trading results through its corporate website and specialised software.

In 2016, Moscow Exchange conducted a marketing survey among traders and market newswires that demonstrated general satisfaction with the volume and structure of the trading information, as well as the level of technology used in its circulation, and client support offered by the Exchange as part of such information services.

At the same time, this review helped the Exchange to identify new points of growth in the development of its information services, delivering a more clear-cut structure, consolidating data sources, and establishing universal interfaces for sharing information from all Group companies.

Moscow Exchange launched a new trading information service offering reference data and containing lists of instruments quoted on the Exchange, its trading modes and risk parameters, accessible through the MOEX's website interface.

The Exchange expanded the geographies where quotation data is offered: the Exchange entered into cooperation agreements for the sale and purchase of trading information with new global vendors, as well as international financial holdings. Moreover, the Shanghai Stock Exchange became MOEX's official partner for distribution of market data, with the right to issue relevant licenses in mainland China.

## Analytical Products

Moscow Exchange is a unique source of financial market data. It regularly publishes analytic reviews in the form of indicators and reports on markets and the structure of trading.

In particular, the Market Structure product includes aggregated trading data used in calculation of derived indices of an instrument or a group thereof, broken down by investor type. This product has been developed with a view to making the market more coherent and transparent for professional participants and investors, and to creating tools facilitating decision-making and risk management processes.
